

Note on rmf of SXI

Tsuru, Matsumoto (Kyoto)

Feb. 26, 2009

- QE is the current best estimate from the structure model of CCD.
- $200\ \mu\text{m}$ thick with OBL
- ΔE and the line response @ low energy are NOT best estimates. Too good.
- Please do not believe them at this moment.
- At least they have been not confirmed by experiment.
- I guess that only read-out noise of $3e^-$ or XIS-BI may be considered.
- I will check it when I go back to Kyoto. I hope it will be revised.
